

1. Bresenham Line Drawing Algorithm

Also

- Step 1: Start
- Step 2: Declare required variable $x_1, x_2, y_1, y_2, i_1, i_2, d, dx, dy$
- Step 3: Assign values to x_1, x_2, y_1, y_2
- Step 4: Calculate $dx = x_2 - x_1$
Calculate $dy = y_2 - y_1$
Calculate $i_1 = 2 * dy$
Calculate $i_2 = 2 * (dy - dx)$
Calculate $d = i_1 - dx$
- Step 5: Consider (x, y) as starting points and x_{end} as maximum value possible for x
- If $dx < 0$
Then Assign: $x = x_2$
 $y = y_2$
 $x_{end} = x_1$
- If $dx > 0$
Then $x = x_1$
 $y = y_1$
 $x_{end} = x_2$
- Step 6: Generate (x, y)
- Step 7: Check if generation is complete
If $x \geq x_{end}$
then Stop
- Step 8: Calculate: If $d < 0$: $d = d + i_1$; If $d \geq 0$: $y++$
- Step 9: $x++$
- Step 10: Draw new values of (x, y)
- Step 11: Go to Step 7
- Step 12: Stop

P1. Bresenham LDA code

```
#include <stdio.h>
```

```
#include <graphics.h>
```

```
void draw (int x0, int y0, int x1, int y1)
```

```
{ int dx, dy, p, x, y;
```

```
  dx = x1 - x0;
```

```
  dy = y1 - y0;
```

```
  x = x0;
```

```
  y = y0;
```

```
  p = 2 * (dy) - dx;
```

```
  while (x < x1)
```

```
  { if (p >= 0) {
```

```
    putpixel (x, y, 7);
```

```
    y = y + 1;
```

```
    p = p + 2 * dy - 2 * dx;
```

```
  }
```

```
  else {
```

```
    putpixel (x, y, 7);
```

```
    p = p + 2 * dy;
```

```
    x = x + 1;
```

```
  }
```

```
}
```

```
int main () {
```

```
  int gd = DETECT, gm, ar, x0, y0, x1, y1;
```

```
  initgraph (&gd, &gm, "C:\\Programs\\Turbo C3\\bg1");
```

```
  printf ("Enter coordinates of first point ");
```

```
  scanf ("%d %d", &x0, &y0);
```

```
  printf ("Enter final point coordinates");
```

```
  scanf ("%d %d", &x1, &y1);
```

```
  draw (x0, y0, x1, y1);
```

```
  return 0;
```

```
}
```
